SendShield

#1 in Metadata Security for Microsoft Outlook

Be aware of what Data you're *really* sending in attachments.

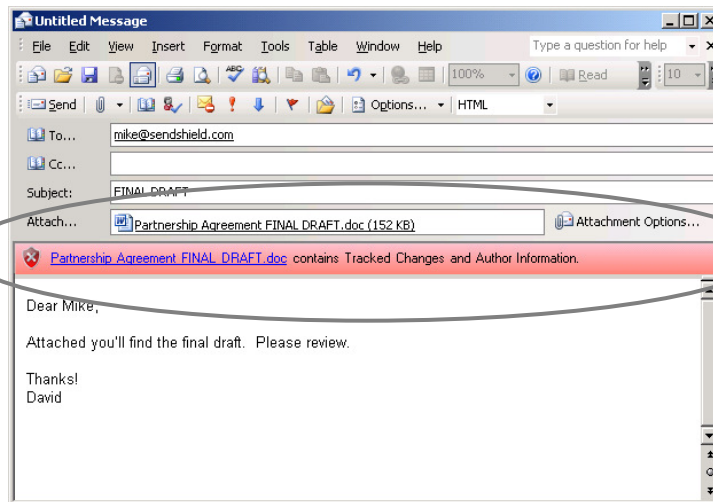

Microsoft Office files almost always contain Hidden Data, also known as "metadata." Word files often contain Tracked Changes and Comments, and they almost always contain information about the Author. PowerPoint and Excel files contain similar types of Hidden Data.

Protect yourself from Data Leaks.

Hidden Data in your email attachments could contain private, confidential and potentially embarrassing information. It can be hard to remember to analyze all attachments for the presence of Hidden Data, and most users often don't know how to remove it.

SendShield is a new approach to analyze and sanitize attachments.

For Microsoft Outlook users, no technology is faster or better-integrated than SendShield. Once installed, SendShield performs real-time scanning in the background, and provides subtle alerts which do not interrupt your work flow. Enjoy peace of mind and maximum productivity with data security that does not slow you down with unnecessary dialog boxes and waiting. Quickly review the Hidden Data, and then clean and/or convert files to PDF format with the click of a button.

"SendShield's minimal and unobtrusive alerts stay in the background and don't interrupt your work."

"They're there for you only if you need them."

SendShield Standard

Unlimited scanning and cleaning of Microsoft Word, PowerPoint and Excel files, right inside your Outlook.

SendShield Professional

Unlimited scanning PLUS includes instant-PDF conversion from directly within Outlook.
